Coding Theory and Tree Codes

Nikola Kovachki

Abstract

In this talk, I will briefly introduce classical coding theory then talk about tree codes which are constructs used for interactive communication. There are no known explicit constructions of tree codes, so I will discuss a recently proposed candidate and some sufficient conditions one can establish to prove something is a tree code. I will then talk about some combinatorial approaches, specifically two-variable generating functions, and why our candidate does not meet the stated conditions.
